Problem Description

Everyone is born into this world for some reason, and for reason of existence they believe in god and religion. There are many religions in India. And One of the main religion here is Hinduism. So people following hinduism often visit temples, to worship gods, to show their belief in God and to take darshans so that, they can have a path to pursue in life.

In this modern age many people have hectic schedule and there are many temples but few temples are such that their grace is known to be much more than the other so few people there in n numbers. Due to that, the darshans become very difficult as people want to get darshans at their time and have some work.

So we come up with a system where users are required to register for the darshans for the given time as they can book the devotional aartis at a particular time and work according to their preferred schedule. The users have to fill down the details for registration, timing for darshan so that they will get a token for darshan. The arrangements will be done by the Temple management to do the required worship apart from the queue. They need to show the token to get the special entry. Finally they will get the darshans without any hesitation and without difficulty at their time.
